Flame Detectors

QRA2...
QRA10...
QRA53...
QRA55...
QRA73...
QRA75...

The UV flame detectors are designed for use with Siemens burner controls, for the supervision of gas or oil flames.

The QRA and this Data Sheet are intended for use by OEMs which integrate the flame detectors in their products.

The flame detectors are used for the supervision of gas flames, yellow- or blue-burning oil flames and for ignition spark proving.

The QRA is suitable for the following burner controls:

Flame detector	For use with burner control type	Operating mode
QRA2, QRA10.C	LGB2 / LGB4 s AGQ1 LFL LFE1 LFE10 LFS1.2 LME11 / LME21 / LME22 / LME39 / LME41 / LME44 with AGQ3 LME71 / LME72 / LME73 / LME76 with LFS1.2 LMV2 / LMV3 LMV5 s AGQ1	Intermittent
QRA2M, QRA10M.C	LME7, LFL, LMV2/LMV3, LFS1	Intermittent
QRA53, QRA55	LGK16 LGI16	Continuous operation
QRA73, QRA75	LMV5 LME75	Continuous operation

The QRA can also detect flames caused by the combustion of green fuel blends with fuel oil. Green fuels are liquid energy carriers that are produced synthetically on the basis of renewable energies. Hydrogen produced by electrolysis using green electricity can be synthesized into a liquid energy source when combined with carbon obtained from CO₂. The associated combustion is carbon neutral. Examples of green fuels include paraffinic fuels such as hydrogenated vegetable oils (HVO) and other fuels such as OME (oxymethylene ethers 3, 4, and 5).

To avoid injury to persons, damage to property or the environment, the following warning notes must be observed!

It is not permitted to open, interfere with, or modify the detector. Siemens will not assume liability for damage resulting from unauthorized interference!

- All activities (mounting, installation and service work, etc.) must be performed by qualified staff
- Before carrying out any work on the flame detector, isolate the power supply completely (all-polar disconnection). Check the power supply with a suitable voltage test and secure the power supply against being switched on again unintentionally.
If not observed, there is a risk of electric shock hazard.
- Ensure protection against electric shock hazard by providing adequate protection for the terminals. If this is not observed, there is a risk of electric shock
- Each time work has been carried out (mounting, installation, service work, etc.), check to ensure that wiring is in an orderly state. Failure to observe this information poses a risk of failure of the safety functions and a risk of electric shock
- Halogen lamps, welding equipment, special lamps or ignition sparks may produce sufficient radiation for the detector's UV cell to ignite. X-rays and gamma radiation can also generate erroneous flame signals. If this is not observed, there is a risk of loss of safety functions
- Fall or shock can adversely affect the safety functions. Such units must not be put into operation, even if they do not exhibit any damage. Failure to observe this information poses a risk of failure of the safety functions and a risk of electric shock

Mounting notes

- Ensure that the relevant national safety regulations are complied with
- Tightening torque for QRA2 housing screws: Max. 0.3 Nm

Installation notes

Always run the detector cable separate from other cables, especially from high-voltage ignition cables, while observing the greatest possible distance.

Electrical connection of the flame detector

It is important to achieve practically disturbance- and loss-free signal transmission:

- Never run the detector cable together with other cables
 - Line capacitance reduces the magnitude of the flame signal
 - Use a separate cable
- Observe the permissible lengths of the detector cable (refer to «Technical data» in the Data Sheet for the relevant burner control)
- The connection cables must be run through protective tubing (made of plastic or earthed metal)

Trouble-free burner operation is ensured only when the intensity of UV radiation at the detector's location is high enough for the detector's UV cell to ignite during each half wave. The **intensity of UV radiation** at the detector's location is **checked** through **measurement of the detector current** (refer to the data sheet of the relevant burner control)..

Measuring circuit for
QRA2,
QRA10.C/QRA10M.C,
QRA5 series D and
QRA5 series G

Legend

- 1) Connection of micro-ammeter across AGQ1 / AGQ2 / AGQ3 adapter and flame detector
- 2) Only in combination with QRA2M and QRA10M.C
- A Incidence of radiation
- M Micro-ammeter (DC), internal resistance $\leq 5000 \Omega$
- C Electrolytic capacitor 100...470 μF , DC 10...25 V

Measuring circuit for
QRA5 up to the C-
series and QRA5 series
E

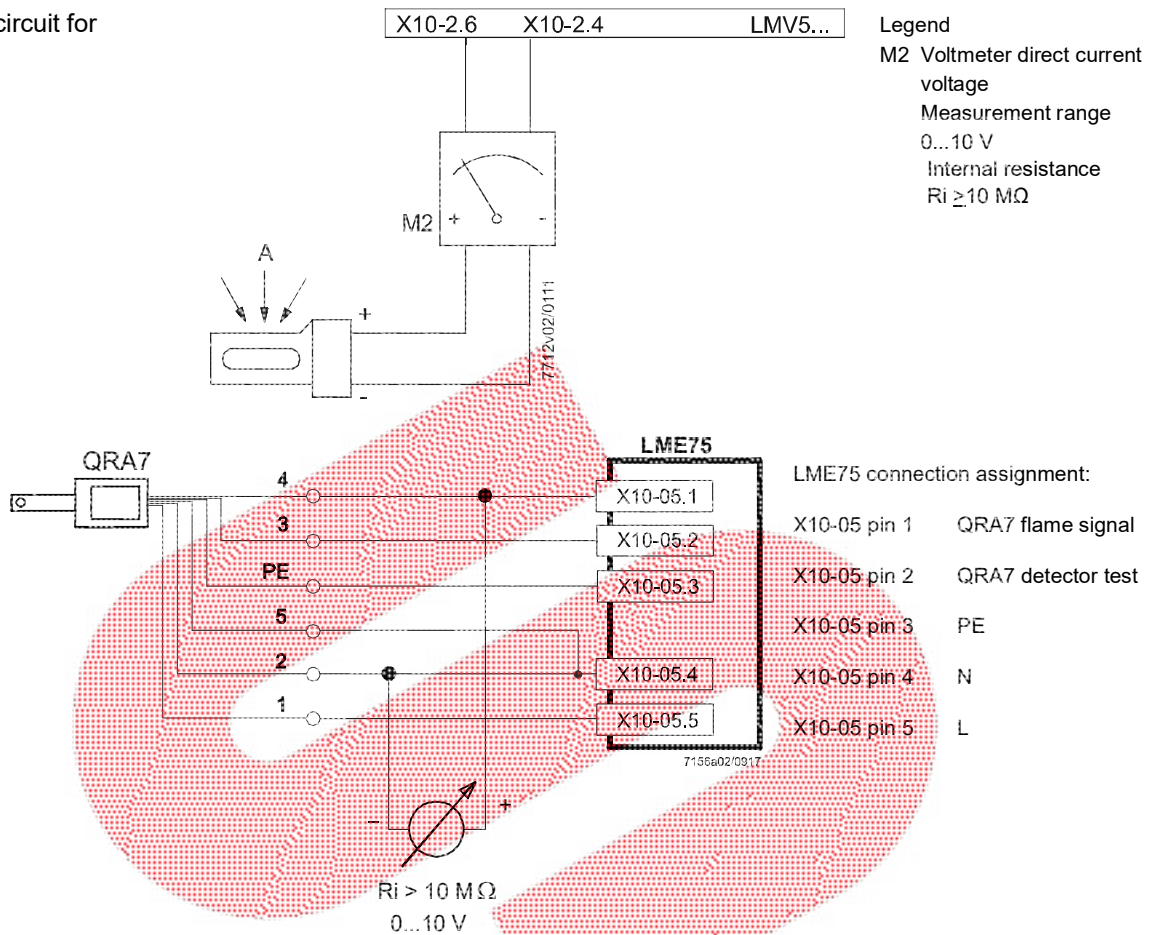

Note!
The KF8832 flame detector current measuring device must not be used in continuous operation!

Minimum detector current values required:
Refer to the Data Sheet for the relevant burner control.

Commissioning notes (cont'd)

Measuring circuit for
QRA7

Certificates

Note!
Only in connection with burner controls!

EAC Conformity mark (Eurasian Conformity mark)

China RoHS
Hazardous substances table:
<http://www.siemens.com/download?A6V10883536>

Service notes

Use the KF8832 service unit for short periods of time only.

Disposal notes

The QRA contains electrical and electronic components and must not be disposed of together with domestic waste. Local and currently valid legislation must be observed.

Mechanical design

Flame detectors QRA2 Plastic housing metalized to prevent static charging caused by the air flow from the fan. For mounting direct on the burner. The detectors can be supplied with or without securing flange (version 4 241 8855 0/4 241 8898 0) and clamp (refer to «Type summary»).

Flame detectors QRA10.C / QRA10M.C Die-cast aluminum housing with a mounting coupling D and connection facility for cooling air. The housing of this detector has a bayonet fitting which allows it to be secured either directly to the mounting coupling D or to the AGG06 glass holder. The mounting coupling D can be screwed to a viewing tube or to the AGG07 ball head. The Pg cable gland can be removed and replaced, if some other detector cable shall be used.

Flame detectors QRA5, QRA7 The detector's UV cell is located behind a swiveling shutter at the front end of the detector tube which is flanged to the housing. A quartz-glass window protects the tube and the shutter against dirt. The detector's housing accommodates a stepper motor to drive the shutter and the electronics to control the shutter. QRA5 series E and G differ with regard to the closing interval of the orifice. Using the AGG16.C adapter, this flame detectors can be mounted either directly on the burner, on a viewing tube or on a combustion chamber viewing hole.

Connecting cable AGM19 For the electrical connection of the flame detector QRA53 and QRA55.

Connecting cable AGM23 For the electrical connection of the flame detector QRA7.

Connecting cable AGM23U For the electrical connection of the flame detector QRA7, USA version.

 **Note!**
Applications in the USA are only possible with AGM23U.

Mounting coupling D Using the bayonet fitting, the mounting coupling D can be attached either to the AGG06, the AGG16.C or the QRA10.C / QRA10M.C flame detector. The mounting coupling D is supplied with the QRA10.C / QRA10M.C or AGG16.C.

Adapter AGG16.C Adapter AGG16.C for QRA5 and QRA7 made from die-cast aluminum, including mounting coupling D, which is fixed to the housing with a bayonet fitting.

Figure: QRA5/QRA7 with AGG16.C, including threaded socket 'D'

Mechanical design (cont'd)

Quartz-glass lens
AGG03

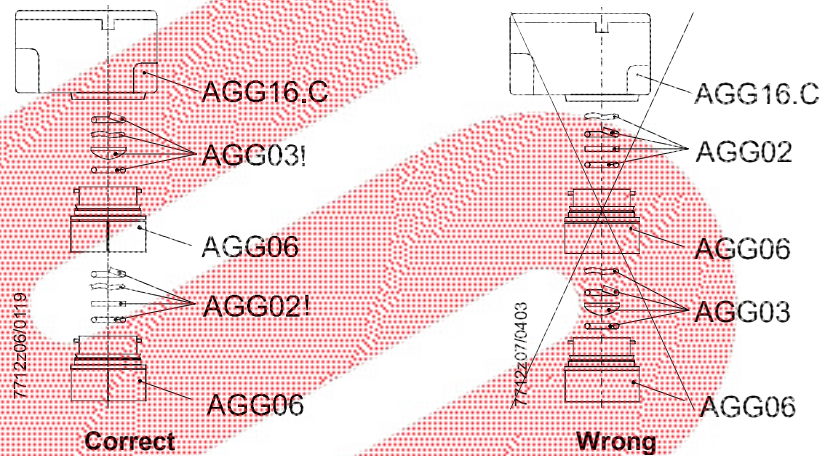

AGG03 with spring washer and O-ring for increasing the sensitivity.

Heat insulation glass
AGG02

AGG02 with spring washer and O-ring. This heat insulation glass is required on applications where the temperature at the flame detector exceeds 80 °C. The AGG02 extends the life cycle of the UV cell.

Glass and quartz-glass
lens holder AGG06

The glass and quartz-glass lens holder AGG06 serves for holding the AGG03 lens and the AGG02 heat insulation glass. The AGG06 also allows various combinations of lens, heat insulation glass and mounting coupling D. When using the lens and the heat insulation glass, the AGG06 with the lens must be mounted as close as possible to the flame detector.

AGG06 has a bayonet fitting with which it is attached either to the housing of the AGG16.C or to the housing of the QRA10.C/QRA10M.C and the 1 mounting coupling D. By undoing the bayonet fittings on both sides, the AGG06 glass holder(s) can be easily detached from the combination of QRA10.C/QRA10M.C or AGG16.C and QRA53 or QRA55. This facilitates straightforward cleaning of the glass or lens without having to remove them from the AGG06 glass holder. The intermediate rings are used for the smooth running of the bayonet fittings, especially where – after removal of the flame detector – the hole to the combustion chamber serves as a viewing tube. By fitting the intermediate ring to the appropriate bayonet connection, the combination can be undone where required by rotating the housing of the QRA10.C/QRA10M.C or AGG16.C

Note!
AGG02 or AGG03 can also be fitted in the mounting coupling D of the AGG16.C or the QRA10.C/QRA10M.C.

Nipple AGG05

1 in. nipple AGG05 for connecting the mounting coupling D to the AGG07 ball head.

Mechanical design (cont'd)

Ball head AGG07

AGG07 with 1 in. internal thread. Connection on AGG05 and for use with the mounting coupling D and AGG06. The AGG07 is used for mounting on a rigid surface, such as the boiler wall. It facilitates optimum adjustment of the viewing angle.

Accessories combinations

Type summary

When ordering, please give type references according to the *Type summary*.

	• QRA10.C/QRA10M.C	Supplied by customer Recommended: H05VV-F 3 x 0.75 Observe the application standards!
	• QRA53 / QRA55	Connecting cable AGM19
	• QRA73 / QRA75	Connecting cable AGM23

Notes

Lifetime of the UV cell.

UV cells and the QRA2/QRA10.C/QRA10M.C are subject to wear and tear and must be replaced as part of regular maintenance, at the latest at the end of the average lifetime of the UV cell. The lifetime of the UV cell corresponds to approx. 10,000 hours at a maximum of +50°C; higher ambient temperatures reduce the lifetime considerably.

Technical data (cont'd)

Environmental conditions

Storage

Temperature range	-20...+60 °C
Humidity	<95 % r.h.

Transport

Temperature range	-20...+60 °C
Humidity	<95 % r.h.

Operation

Temperature range	-20...+60 °C
Humidity	<95 % r.h.
Installation altitude	Max. 2,000 m above sea level

Caution!

Condensation, formation of ice and ingress of water are not permitted!
Failure to observe this information poses a risk of failure of the safety functions and a risk of electric shock.

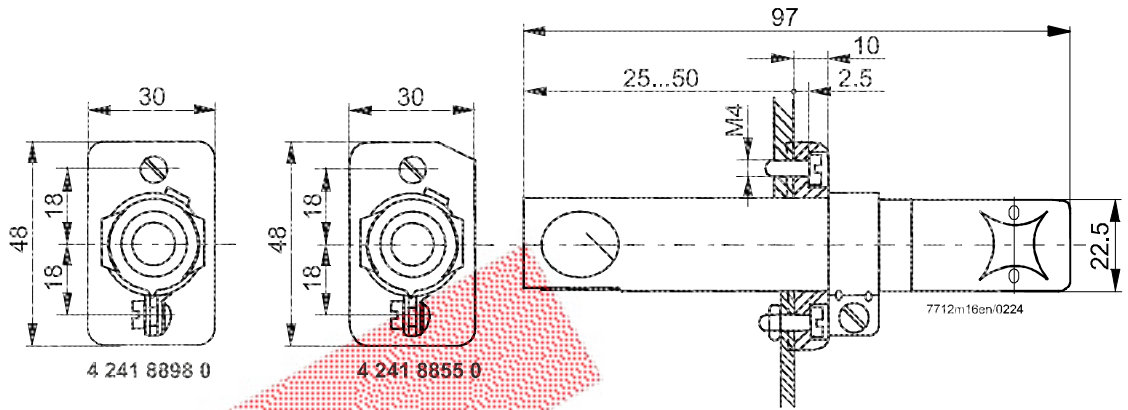

Function

With this type of flame supervision, the UV radiation emitted by gas or oil flames is used to generate the flame signal. The radiation detector consists of a UV-sensitive cell with 2 electrodes, which ignite when illuminated with radiation in the 190...270 nm range of the spectrum, thereby triggering a current in the flame detector circuit. The UV cell does not respond to glowing firebrick in the combustion chamber, daylight or light from boiler room illumination.
